

# Handling short instructions for

## TINA-PROFINET-Upgrade

### Construction:

Connect the adapter with the two supplied LAN-cables to TINA at the corresponding LAN-sockets 1t 1 as the ports are described.

TINA-PROFINET-Upgrade Port A	<=>	TINA Port A
TINA-PROFINET-Upgrade Port B	<=>	TINA Port B

The PROFINET is connected to the adapter on the two lateral RJ45 sockets.

TINA-PROFINET-Upgrade Port Master	<=>	to PROFINET-master
TINA-PROFINET-Upgrade Port Slave	<=>	to PROFINET-slaves

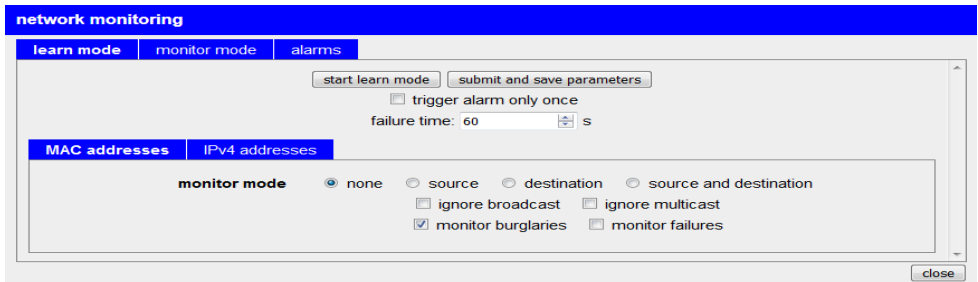

As a result, you have now turned TINA into a PROFINET-Watchdog. With the help of the adapter, TINA can no longer write to the connected PROFINET, but only act as a listener. As a result, there can be no influence on bus-telegrams.

Please upgrade the firmware of your TINA to the current version, otherwise you will not be able to use or use all offered functions.

## Analysis of the ProfiNet network :

The "new" ProfiNet-WATCHDOG is able to analyze the network traffic of the connected ProfiNet. Due to the structure as described, you have guided your ProfiNet through the ProfiNet-WATCHDOG, without having to worry about impairments in the real-time behavior.

In order to set the network monitoring or to display the current status, you must click on the icon  which can be found in the toolbar. Now the following dialog opens:

The screenshot shows a dialog box titled "network monitoring". It has three tabs: "learn mode", "monitor mode", and "alarms". The "learn mode" tab is currently selected. Inside this tab, there are two buttons: "start learn mode" and "submit and save parameters". Below these buttons, there is a checkbox labeled "trigger alarm only once" and a text field labeled "failure time: 60" with a unit selector set to "s". Below this, there are two sub-tabs: "MAC addresses" and "IPv4 addresses". The "monitor mode" sub-tab is selected. Under "monitor mode", there are four radio buttons: "none" (selected), "source", "destination", and "source and destination". There are also two checkboxes: "ignore broadcast" and "ignore multicast". At the bottom, there are two checkboxes: "monitor burglaries" (checked) and "monitor failures". A "close" button is located at the bottom right of the dialog.

The dialog has a bar with the following tabs:

- **learn mode:** Here you can set the parameters for the network monitoring and (if desired) start the automatically learning of addresses.
- **monitor mode:** Here you can view and adapt the current parameters of the network monitoring and manage the addresses of the monitoring.
- **alarms:** Here you have the possibility to manage a list with addresses who have triggered a burglary alarm.

### Important:

**Please note that depending on your configuration an e-mail get's sent for each burglary and failure. This can lead to an enormous number of e-mails. You should check your settings carefully before enabling the e-mail shipping.**

An detailed description as well as an explanation of the single web pages can be found in the manual of this device. The user manual can be found on the product page of our web page under the download section *Documentation* → *Handbook TINA / ProfiNet-WATCHDOG*.

## Connecting S7-/S5-PLCs without head-station

Pair your S7 directly with your S5, thanks to the active PUT/GET in the S7-LAN no problem.

Each MPI/Profibus-CPU exchanges data directly without using a CP.

No head-control or changes in the S5-PLC needed.

## Failure report transmission released by the PLC

Your outstation reports the current value cyclically, or in case of malfunction the status via FAX, as SMS to your mobile phone, to your pager or also via e-mail.
